

## Commercial Solar and what it can do for you?

In all states in Australia, feed in tariffs have mostly been removed for new entrants, however for commercial power users solar is an option that just makes sense for the following reasons:

1. Solar produces power during the day when businesses are operating and can use the power generated.
2. Commercial customers cost of producing power from solar is significantly cheaper than buying power from your retailer.
3. Offsets the ever future rising cost of electricity from the grid
4. Solar power is a mature technology where the power output is well documented and understood.

**Solar power provides electricity to your business throughout the day, blending seamlessly with your grid connected supply, and decreasing your demand on the grid.**

*Solar power offsets your day-time consumption*

## How to make sure Commercial Solar works for you

1. Your solar vendor needs to match-up your business's time of day power usage with, compared to the proposed system future solar generation at your location.
2. Typically this is modelled over an entire calendar year, using data obtained from your power retailer.
3. Make sure that the consultant solar vendor is using a professional toolset that will show both kWh saved as well as demand in kW or KVA reduced over a year.

***This is the only way, you can be assured that solar power can be a solid and predictable financial investment.***

SmartConsult provides professional consulting services for Industrial and Commercial sites looking to install Solar Systems, of all sizes throughout Australia.
